Piezo valves VEMP

Key features

Innovative

- Piezo technology
- Very low power consumption
- High precision

Versatile

- When combined with pressure sensor and control electronics it can be used as a proportional pressure regulator
- When combined with a flow sensor and control electronics it can be used as a proportional flow control valve

Reliable

- No self-heating
- Long service life

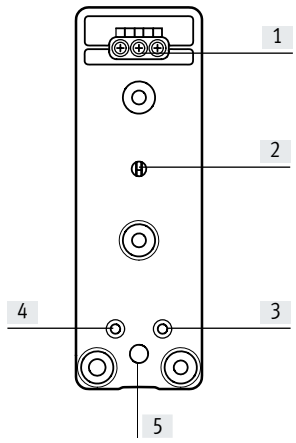
Easy to mount

- Can be mounted on a terminal strip
- Small installation space
- Light weight

Key features

Mode of operation

Description



[1] Electrical connection
[2] Port for pressure sensor
[3] Port 1 (pressure supply port)
[4] Port 3 (exhaust port)
[5] Port 2 (working port)

The VEMP is a proportional 3/3-way valve in which a split piezo actuator (piezo actuator 1 and 2) is controlled electrically. The valve also has a connection for a pressure sensor.

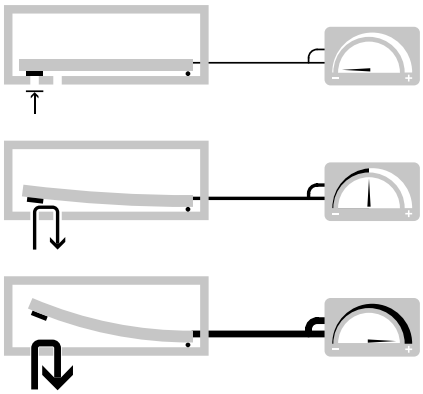
When combined with a pressure sensor and control electronics, the 3/3-way proportional valve can be used as a proportional pressure regulator.

Alternatively, the flow can also be controlled using a closed loop circuit by integrating a flow sensor in the output line (operation as 2/2-way valve).

In the normal position, the valve is closed. The working and pressure sensor ports are connected and always open, regardless of the switching status.

The two piezo actuators can only be actuated separately; if they are activated simultaneously, safe and reliable operation cannot be ensured.

Control response



No voltage
No flow rate

Medium voltage
Medium flow rate

High voltage
High flow rate

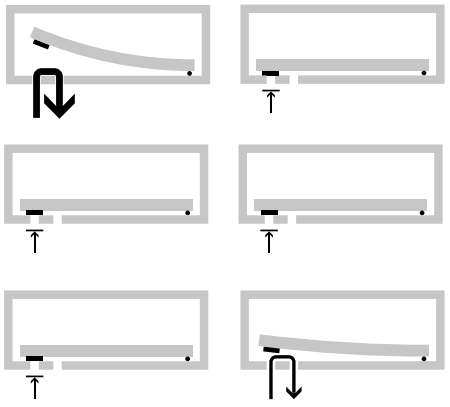
The piezo actuators are actuated using variable voltage to give proportional control.

This allows either the pressure or flow rate to be controlled, depending on the design.

The pressure or flow behaviour is controlled by integrating a sensor in the output line of the closed-loop control circuit.

The piezo valve VEMP exhibits the typical hysteresis behaviour of a proportional valve. Linear behaviour can be achieved by combining control electronics with a flow sensor.

Operation as a proportional 3/3-way valve



Pressure build-up

Maintaining pressure

Reducing pressure

Pressurisation, piezo actuator 1

Pressurisation, piezo actuator 2

The piezo actuators installed in the valve VEMP proportionally regulate both the pressure and flow rate for pressurisation and ensure proportional exhausting.

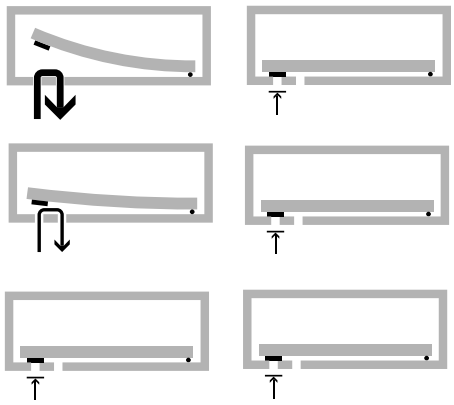
Pressurisation:
During pressurisation, piezo actuator 1 opens, enabling flow from port 1 (pressure supply port) to port 2 (working port). At the same time, piezo actuator 2 closes port 3 (exhaust).

Exhausting:
During exhausting, piezo actuator 2 opens, enabling flow from port 2 (working port) to port 3 (exhaust). At the same time, piezo actuator 1 closes port 1 (pressure supply port).

Key features

Mode of operation

Operation as a proportional 2/2-way valve

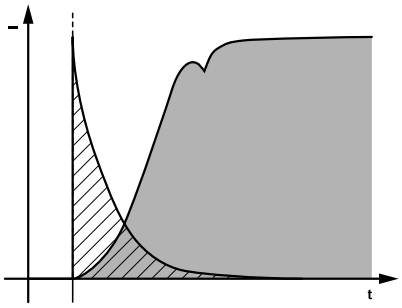


When used as a proportional 2/2-way valve, only piezo actuator 2 (exhaust) is switched; piezo actuator 1 (pressure supply port) must be electrically connected to earth (GND).

Flow takes place from port 2 (working port) to port 3 (exhaust). When used as a 2/2-way valve, port 1 (pressure supply port) is not used, and must be closed.

The flow behaviour is controlled by integrating a sensor in the supply or output line of the closed-loop control circuit.

Low energy consumption



Compared with solenoid valves, proportional valves with piezo technology require virtually no energy to maintain an active state thanks to their capacitive principle. The piezo valve operates like a capacitor: it needs current only at the start in order to charge the piezoceramics.

No further energy is needed to maintain its state. The valves therefore generate no heat. They consume up to 95% less energy than solenoid valves, which permanently require an electrical current
